

Reversed Roadside-Skipper

Reversed Roadside-Skippers are rare in Alabama, known only from a few sightings. They are multi-brooded, flying spring, summer, and fall. Their colonies are found in wetland areas that support cane species; typically, in pine savannas. Males perch to search for females, often in the cane patch. Both sexes nectar from nearby flowers.

- Medium-sized roadside-skipper
- Sexes similar. Male has a stigma, but it is virtually invisible against the dark brown wing color.
- Worn individuals may be very difficult to identify.
- May be confused with Pepper and Salt Skippers and Bell's Roadside-Skippers. Reversed Roadside-Skippers lack the checkered wing fringe that is typical of Pepper and Salt Skippers and Bell's Roadside-Skippers.
